

Hypergraph Contrastive Learning

2025-08-28

InHyeok Jeong

School of Computer Science and Engineering

Chung-Ang University

MINDS Lab

☐ Background

☐ Challenges

- How to augment a hypergraph?
- What to contrast?

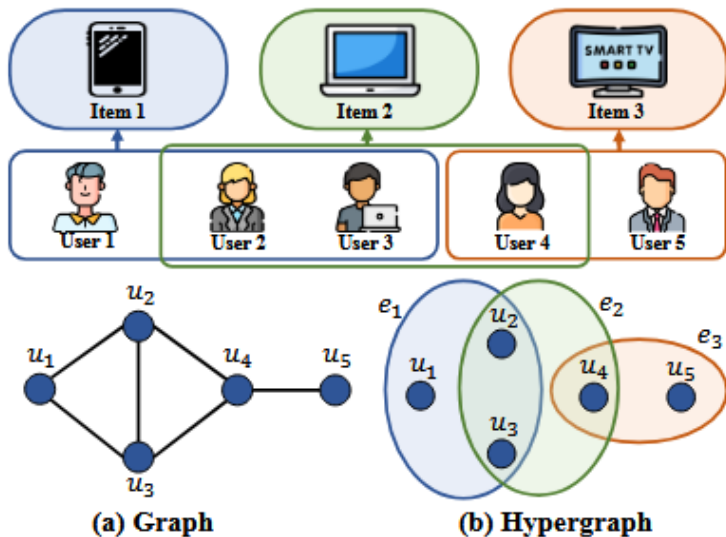

☐ Methods

- HyperGCL
- TriCL
- CASH

☐ Conclusion

□ Hypergraphs can naturally model group-wise relations as hyperedges

- Using graphs can incur information loss

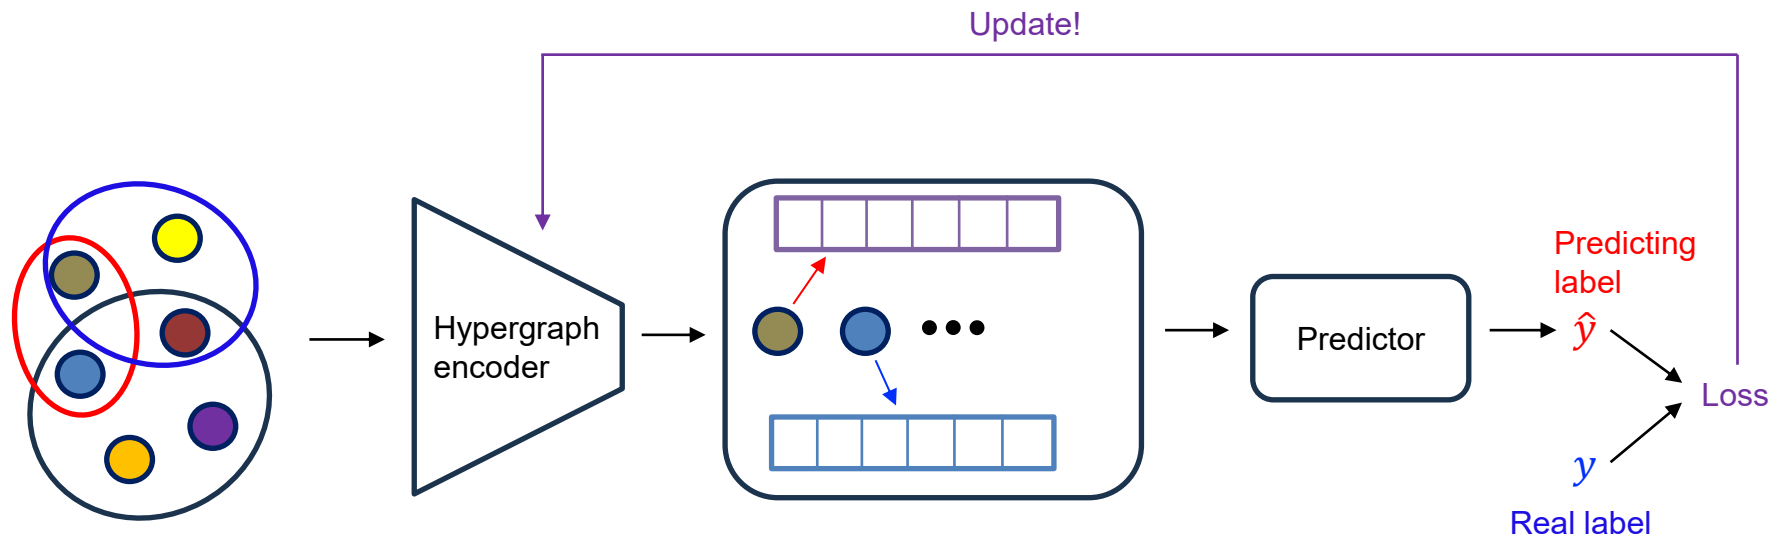

(a) Graph model

(b) Hypergraph model

Fig. 2. Graph and hypergraph representations of Fig. 1 data. Colored hyperedges correspond to different email messages.

Background

□ Hypergraph Neural Networks

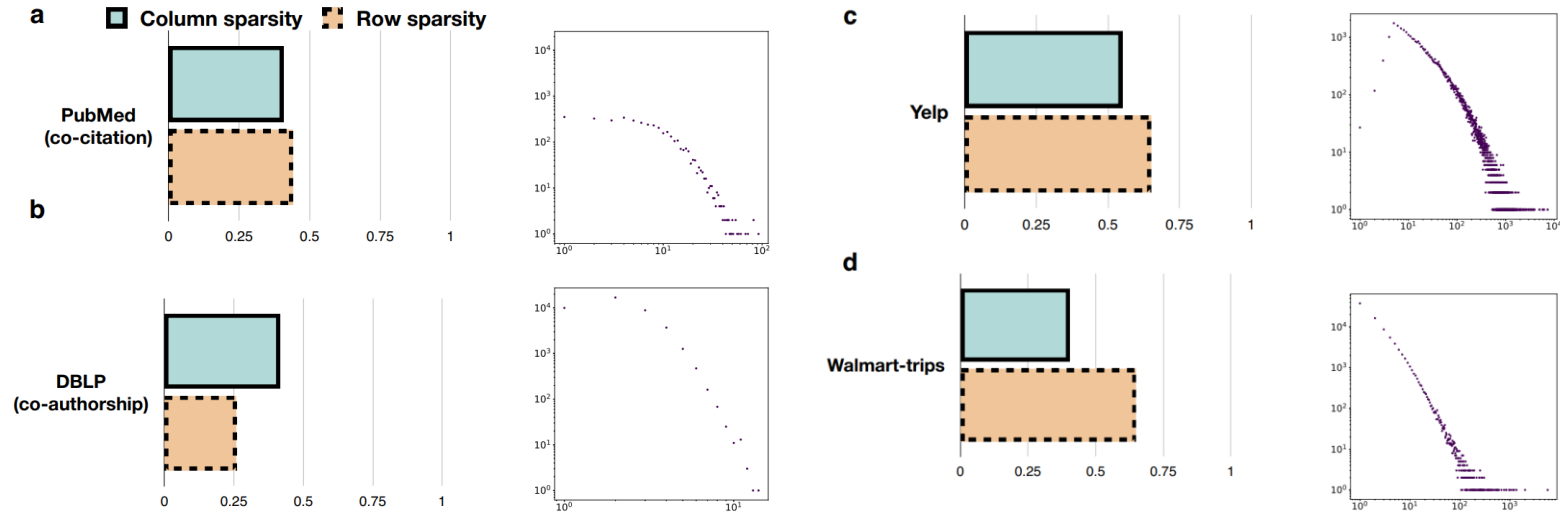

Background

- Hypergraph data labeling is often **time, resource, and labor-intensive**

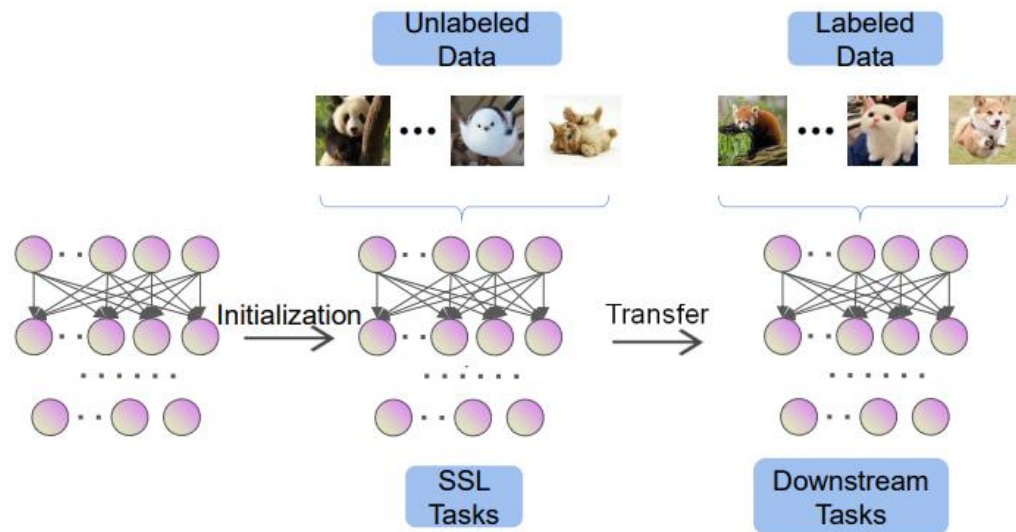

Background

- Real world (hyper)graphs are **‘sparse’**
- Most objects have only a few relationships

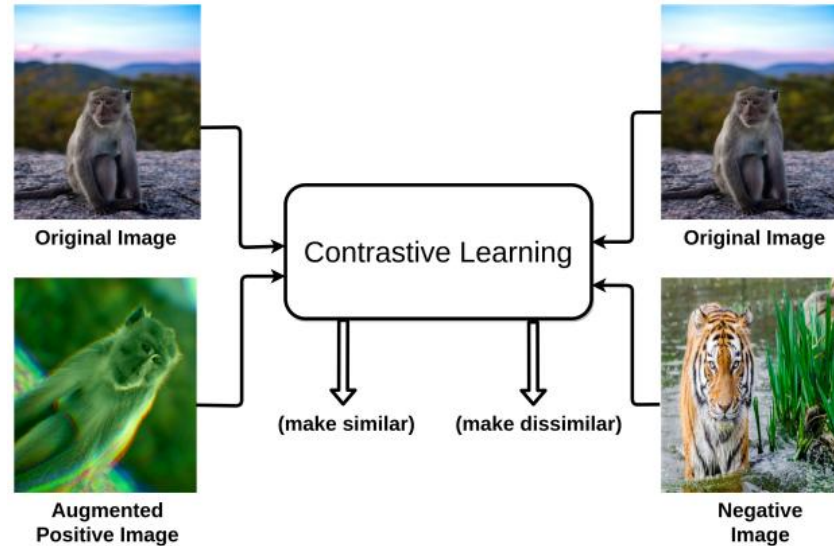

□ Self-Supervised Learning

- learn discriminative features from vast quantities of unlabeled instances without relying on human annotations

□ Contrastive Learning

- Push original and augmented data closer, push original and negative data away

Background

□ Graph Contrastive Learning

■ Graph data augmentation

- Dropping, perturbation and masking

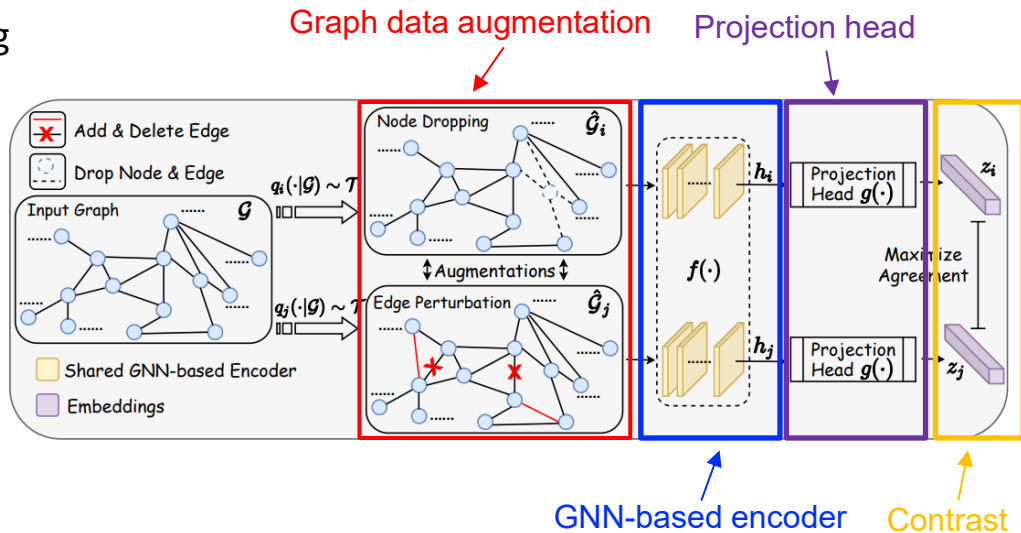

■ GNN-based encoder

- Extract graph-level representation vectors for augmented graphs

■ Projection head

■ Contrastive

- Maximize the consistency between positive pairs compared with negative pairs

Challenges

□ How to augment a hypergraph?

- The choice of views is what controls the information the representation captures

□ What to contrast?

- Node-only contrast cannot reflect higher-order information

How to augment a hypergraph?

□ Augment Hyperedges

■ Hyperedge Perturbation

- Partially missing higher-order relations do not significantly affect the semantic meaning of hypergraphs

■ Generalized Hyperedge Perturbation

- Randomly kick out vertices from hyperedges

How to augment a hypergraph?

□ Augment Vertexes

■ Vertex dropping

- Vertex missing does not alter semantics

■ Attribute masking

- Semantic robustness against losing partial attributes

A3: Drop Vertexes

A4: Feature Mask

How to augment a hypergraph?

□ Subgraph

- Local structure can hint the full semantics

A5: Subgraph

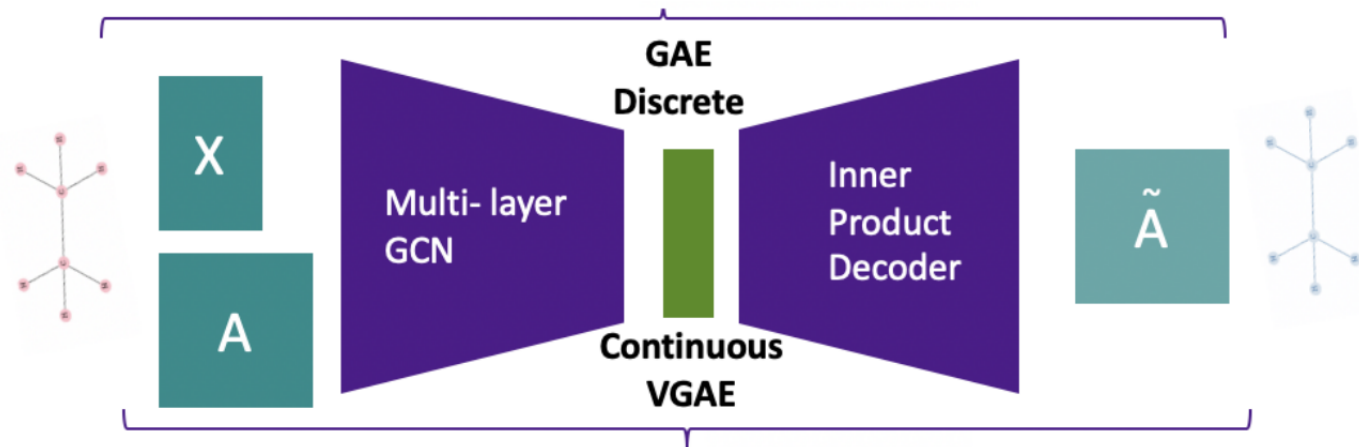

Augmentations in Hypergraph Contrastive Learning: Fabricated and Generative

Tianxin Wei, Yuning You, Tianlong Chen, Yang Shen, Jingrui He,
Zhangyang Wang

22-NeurIPS

□ Motivation

- Augmentation of hypergraph can be learned *during contrastive learning!*
→ Leverage Variational Graph Auto-Encoder!

□ Overview

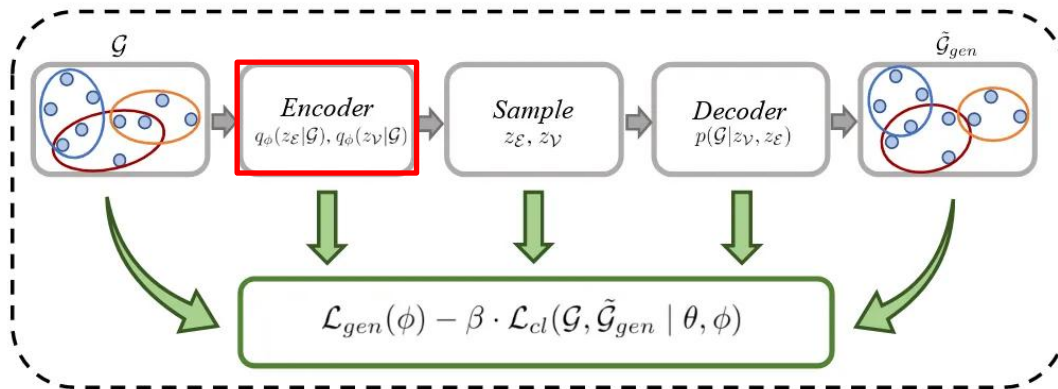

- $f(\cdot), h(\cdot)$: shared encoder and projection head respectively

□ Variational Hypergraph Auto-Encoder (VHGAE)

■ Embed hypergraphs into latent representations

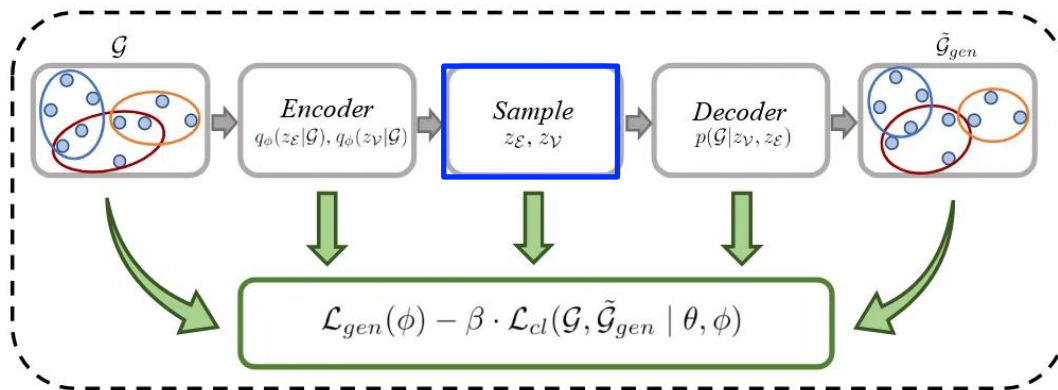

- $z_V \sim q_\phi(z_V|\mathcal{G}) = \mathcal{N}(\mu_V, \sigma_V^2); \mu_V = \text{HyperGNN}_\mu^V(\mathcal{G}), \log(\sigma_V) = \text{HyperGNN}_\sigma^V(\mathcal{G})$
- $z_\mathcal{E} \sim q_\phi(z_\mathcal{E}|\mathcal{G}) = \mathcal{N}(\mu_\mathcal{E}, \sigma_\mathcal{E}^2); \mu_\mathcal{E} = \text{HyperGNN}_\mu^\mathcal{E}(\mathcal{G}), \log(\sigma_\mathcal{E}) = \text{HyperGNN}_\sigma^\mathcal{E}(\mathcal{G})$

□ Variational Hypergraph Auto-Encoder (VHGAE)

■ Apply reparameterization trick

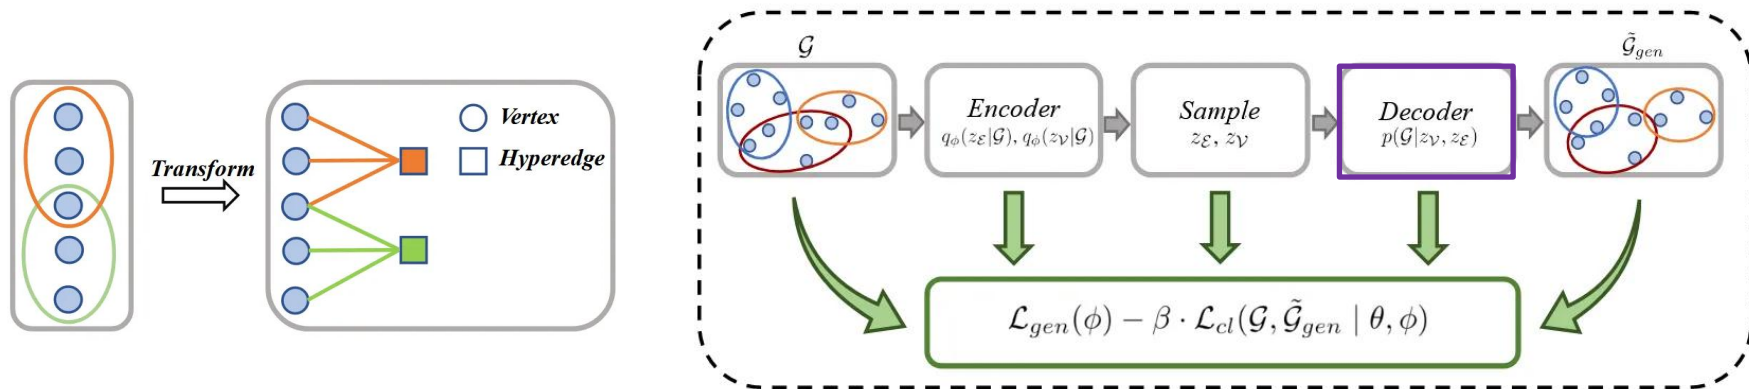

- $z_V = \mu_V + \sigma_V \odot \delta$
- $z_E = \mu_E + \sigma_E \odot \delta$
- $\delta \sim \mathcal{N}(0, I)$

□ Variational Hypergraph Auto-Encoder (VHGAE)

- Reconstruct the higher-order relations of hypergraphs
- Recover the relations on the converted bipartite graph $\tilde{\mathcal{G}} = \{\tilde{\mathcal{V}}, \tilde{\mathcal{E}}\}$

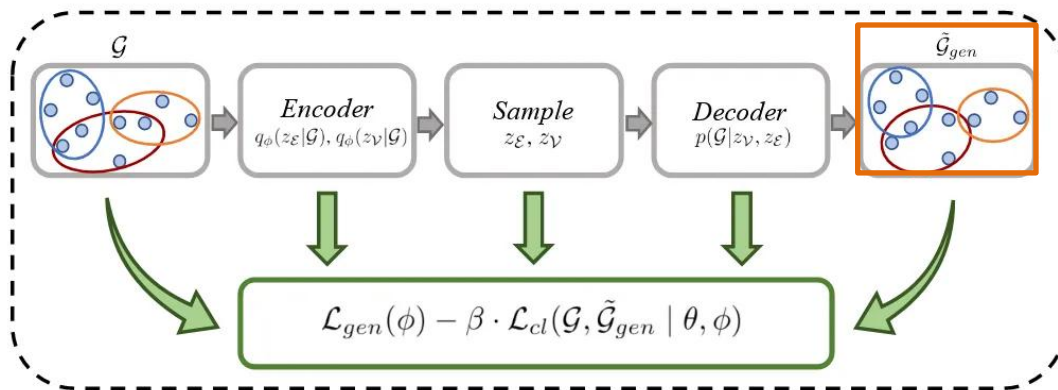

$$p(\mathcal{G}|z_{\mathcal{V}}, z_{\mathcal{E}}) \approx p(\tilde{\mathcal{G}}|z_{\mathcal{V}}, z_{\mathcal{E}}) = \prod_{e=1}^{|\mathcal{E}|} \prod_{v=1}^{|\mathcal{V}|} p(\tilde{\mathcal{E}}_{v,e}|z_v, z_e) = \prod_{e=1}^{|\mathcal{E}|} \prod_{v=1}^{|\mathcal{V}|} \text{Sigmoid}(z_v^T z_e),$$

□ Variational Hypergraph Auto-Encoder (VHGAE)

- Apply the Gumbel-Softmax trick for the hyperedge distribution

$$\begin{aligned}
 T(\mathcal{G}) &= \text{Gumbel-Softmax}(p(\mathcal{G} \mid z_{\mathcal{V}}, z_{\mathcal{E}})) \\
 &= \text{Sigmoid}((w_{\mathcal{V}\mathcal{E}} + \log(\delta) - \log(1 - \delta))/\tau) \\
 \tilde{\mathcal{G}}_{gen} &= T(\mathcal{G}) \circ \mathcal{G},
 \end{aligned}$$

Objective Function

Generator loss

$$\square \mathcal{L}_{gen}(\phi) = -\text{ELBO}$$

Contrastive loss

\square Node-level contrast

$$\square L_{cl}(\tilde{G}_1, \tilde{G}_2) = \frac{1}{2|\mathcal{V}|} \sum_{n=1}^{|\mathcal{V}|} (l(u_n, s_n) + l(s_n, u_n))$$

$$\square l(u_n, s_n) = -\log \frac{e^{\gamma(u_n, s_n)/\tau}}{e^{\gamma(u_n, s_n)/\tau} + \underbrace{\sum_{m \neq n} e^{\gamma(u_n, s_m)/\tau}}_{\text{blue box}} + \underbrace{\sum_{m \neq n} e^{\gamma(u_n, u_m)/\tau}}_{\text{orange box}}}$$

$$\rightarrow \min_{\phi} \mathcal{L}_{gen}(\phi) - \beta \cdot L_{cl}(\mathcal{G}, \tilde{\mathcal{G}}_{gen} | \theta, \phi)$$

□ Training Pipeline

Algorithm 1 Hypergraph Contrastive Learning with Generative Augmentation (A6)

Input: Hypergraph \mathcal{G} ; HyperGNN and generator parameters θ and ϕ ; Multi-task training tradeoff parameters α, β

- 1: Randomly initialize θ and ϕ ;
 - 2: **while** not converge **do**
 - 3: Obtain view $\tilde{\mathcal{G}}_p$ via fabricated augmentation and view $\tilde{\mathcal{G}}_{gen}$ via generator ϕ ;
 - 4: Define HyperGNN loss as: $\mathcal{L}_h = \mathcal{L}_{sup}(\theta) + \alpha \cdot \mathcal{L}_{cl}(\tilde{\mathcal{G}}_p, \tilde{\mathcal{G}}_{gen} \mid \theta, \phi)$;
 - 5: Define generator loss as: $\mathcal{L}_g = \mathcal{L}_{gen}(\phi) - \beta \cdot \mathcal{L}_{cl}(\mathcal{G}, \tilde{\mathcal{G}}_{gen} \mid \theta, \phi)$;
 - 6: Update HyperGNN θ to minimize \mathcal{L}_h ;
 - 7: Update generator ϕ to minimize \mathcal{L}_g ;
 - 8: **end while**
-

□ Datasets

- Split the data into training/validation/test samples using (10%/10%/80%) splitting percentages

□ Comparison among different hypergraph augmentations

- Generalized hyperedge augmentation works the best among fabricated augmenting operators
- Generative augmentation usually performs the best in all the data sets

Table 3: Results on the test data sets: Mean accuracy (%) \pm standard deviation. Bold values indicate the best result. Underlined values indicate the second best. 10% of all vertices are used for training.

I'm Me, We're Us, and I'm Us: Tri-directional Contrastive Learning on Hypergraphs

Dongjin Lee and Kijung Shin

23-AAAI

□ Motivation

Node-only Contrast

- Cannot capture higher-order relations
- Lead to limited expressiveness

Tri-directional Contrast

- Node + Group + Membership contrast
- Preserve higher-order structural information
- Produce richer, more generalizable embeddings

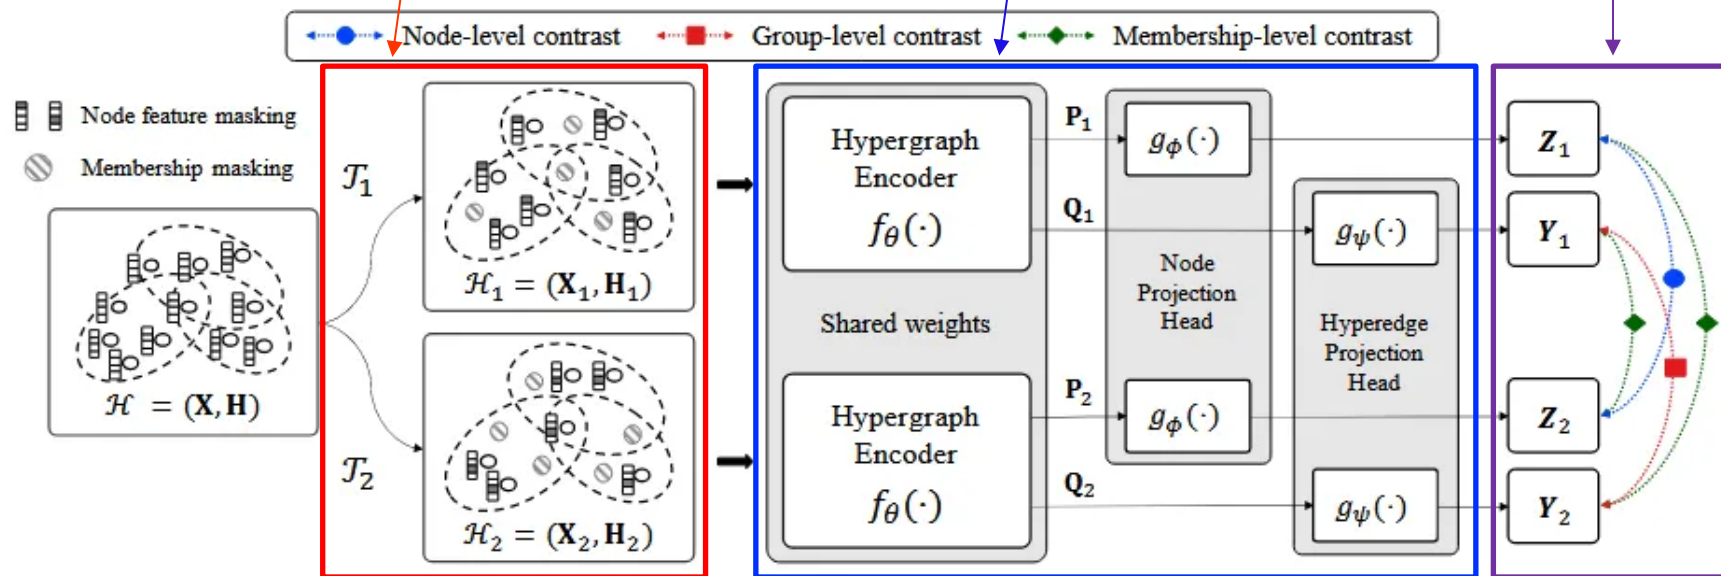

How to augment a hypergraph?	What to contrast?
Δ	\bigcirc

Overview

Generalized Hyperedge
Perturbation + Attribute masking

Form node and hyperedge
representations

Apply three forms of contrast

□ Node-level contrast

- Discriminate the representations of the same node in the two augmented views from other node representations

$$\ell_n(\mathbf{z}_{1,i}, \mathbf{z}_{2,i}) = -\log \frac{e^{s(\mathbf{z}_{1,i}, \mathbf{z}_{2,i})/\tau_n}}{\sum_{k=1}^{|V|} e^{s(\mathbf{z}_{1,i}, \mathbf{z}_{2,k})/\tau_n}},$$

$$\mathcal{L}_n = \frac{1}{2|V|} \sum_{i=1}^{|V|} \{ \ell_n(\mathbf{z}_{1,i}, \mathbf{z}_{2,i}) + \ell_n(\mathbf{z}_{2,i}, \mathbf{z}_{1,i}) \}.$$

□ Group-level contrast

- Distinguish the representations of the same hyperedge in the two augmented views from other hyperedge representations

$$\ell_g(\mathbf{y}_{1,j}, \mathbf{y}_{2,j}) = -\log \frac{e^{s(\mathbf{y}_{1,j}, \mathbf{y}_{2,j})/\tau_g}}{\sum_{k=1}^{|E|} e^{s(\mathbf{y}_{1,j}, \mathbf{y}_{2,k})/\tau_g}},$$

$$\mathcal{L}_g = \frac{1}{2|E|} \sum_{j=1}^{|E|} \{\ell_g(\mathbf{y}_{1,j}, \mathbf{y}_{2,j}) + \ell_g(\mathbf{y}_{2,j}, \mathbf{y}_{1,j})\}.$$

□ Membership-level contrast

- Differentiate a “real” two augmented views
- Learn to represent if relationships actually exist and to move away if they don't exist

$$\ell_m(\mathbf{z}_i, \mathbf{y}_j) = -\log \underbrace{\frac{e^{\mathcal{D}(\mathbf{z}_i, \mathbf{y}_j)/\tau_m}}{e^{\mathcal{D}(\mathbf{z}_i, \mathbf{y}_j)/\tau_m} + \sum_{k:i \notin k} e^{\mathcal{D}(\mathbf{z}_i, \mathbf{y}_k)/\tau_m}}}_{\text{when } \mathbf{z}_i \text{ is the anchor}} - \log \underbrace{\frac{e^{\mathcal{D}(\mathbf{z}_i, \mathbf{y}_j)/\tau_m}}{e^{\mathcal{D}(\mathbf{z}_i, \mathbf{y}_j)/\tau_m} + \sum_{k:k \notin j} e^{\mathcal{D}(\mathbf{z}_k, \mathbf{y}_j)/\tau_m}}}_{\text{when } \mathbf{y}_j \text{ is the anchor}},$$

$$\mathcal{L}_m = \frac{1}{2K} \sum_{i=1}^{|V|} \sum_{j=1}^{|E|} \mathbb{1}_{[h_{ij}=1]} \{ \ell_m(\mathbf{z}_{1,i}, \mathbf{y}_{2,j}) + \ell_m(\mathbf{z}_{2,i}, \mathbf{y}_{1,j}) \}.$$

□ Performance on Node Classification

- Graph contrastive learning methods show significantly lower accuracy compared to TriCL

Table 1: Node classification accuracy and standard deviations. Graph methods, marked as \star , are applied after converting hypergraphs to graphs via clique expansion. For each dataset, the best and the second-best performances are highlighted in **boldface** and underlined, respectively. A.R. denotes average rank, OOT denotes cases where results are not obtained within 24 hours, and OOM indicates out of memory on a 24GB GPU. In most cases, TriCL outperforms all others, including the supervised ones.

□ Performance on Node Classification

- Considering the different types of contrast together can help improve performance

Table 2: Comparison of node classification accuracy according to whether or not to use each type of contrast (i.e., \mathcal{L}_n , \mathcal{L}_g , and \mathcal{L}_m). Using all types of contrasts (i.e., node-, group-, and membership-level contrast) achieves the best performance in most cases as they are complementarily reinforcing each other.

□ Hypergraph augmentation

- Using the structural and attribute augmentations together always yields better performance than using just one

Enhancing Hyperedge Prediction with Context-Aware Self-Supervised Learning

Yunyong Ko, Hanghang Tong, Sang-Wook Kim

25-TKDE

Overview

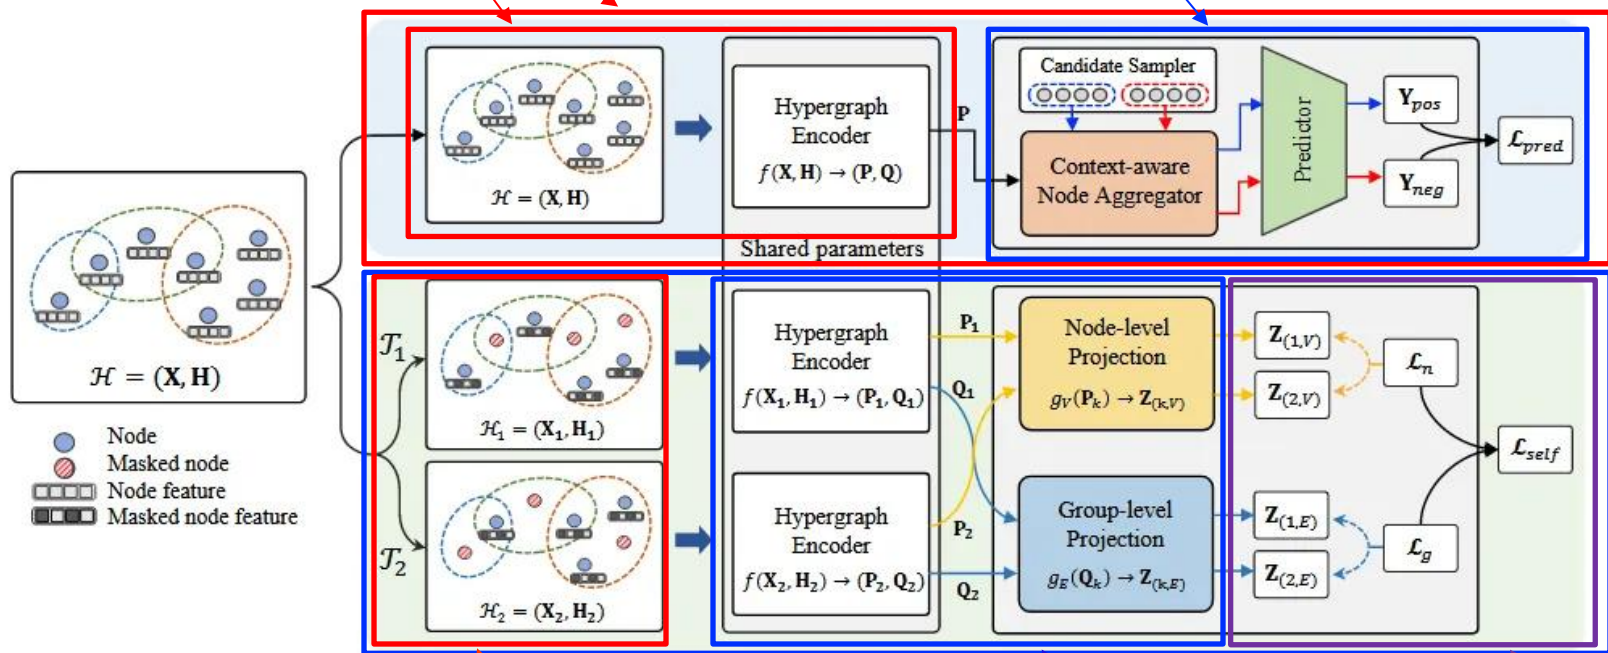

Fig. 2. The overview of CASH: (1) Context-aware hyperedge prediction (upper) and (2) Self-supervised contrastive hypergraph learning (lower).

Hyperedge-aware augmentation

Form node and hyperedge representations

Self-supervised contrastive hypergraph learning

Apply dual contrast

□ Hypergraph encoding

- Produce the node and hyperedge embeddings via a 2-stage aggregation strategy

$$Q^{(k)} = \sigma \left(D_E^{-1} H^T P^{(k-1)} W_E^{(k)} + b_E^{(k)} \right)$$
$$P^{(k)} = \sigma \left(D_V^{-1} H Q^{(k)} W_V^{(k)} + b_V^{(k)} \right)$$

□ Context-Aware Hyperedge Prediction

■ Hyperedge candidate scoring

- Calculate the relative degrees of influences of nodes by using the attention mechanism

$$\alpha_{i,j} = \frac{\exp(p_{v'_i} \mathbf{W}_{agg}'' \cdot x^\top)}{\sum_{v'_j \in e'} \exp(p_{v'_j} \mathbf{W}_{agg}'' \cdot x^\top)}$$

□ Context-Aware Hyperedge Prediction

■ Hyperedge candidate scoring

- Update each node embedding based on the relative degrees of influences

$$p_{v'_j}^* = \sum_{v'_i \in e'} \alpha_{i,j} \cdot p_{v'_i} \mathbf{W}'_{agg}$$

□ Context-Aware Hyperedge Prediction

■ Hyperedge candidate scoring

- Aggregate the influence-reflected embeddings of the nodes via *element-wise max pooling*
- $pred(\cdot)$: a hyperedge predictor (a fully-connected layer ($d \times 1$))

$$\hat{y}_{e'} = pred(q_{e'}^*), \quad q_{e'}^* = MaxPool(P^*[e', :])$$

□ Context-Aware Hyperedge Prediction

■ Model training

□ Use heuristic negative sampling methods

- Sized NS (SNS) : sampling k random nodes (easy)
- Motif NS (MNS) : sampling a k -connected component in a clique-expanded hypergraph (difficult)
- Clique NS (CNS) : selecting a hyperedge e and replacing one of its incident nodes $u \in e$ with a node $v \notin e$ (most difficult)

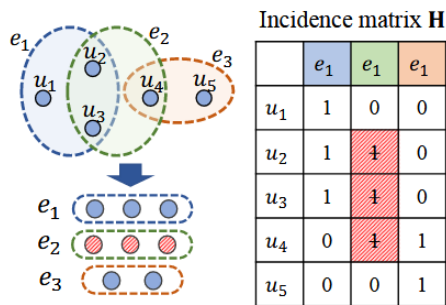

□ Prediction loss

$$\mathcal{L}_{pred} = -\frac{1}{|E'|} \sum_{e' \in E'} \underbrace{y_{e'} \cdot \log \hat{y}_{e'}}_{\text{positives}} + \underbrace{(1 - y_{e'}) \cdot \log (1 - \hat{y}_{e'})}_{\text{negatives}}$$

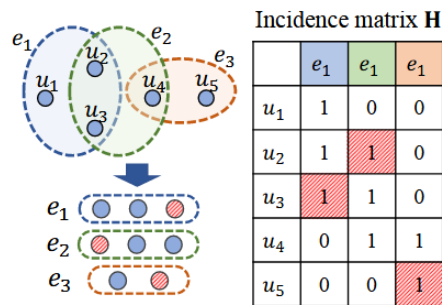

□ Self-Supervised Contrastive Hypergraph Learning

■ Hypergraph augmentation

- Mask random $p_m\%$ members of each hyperedge *individually*
- Mask random $p_f\%$ dimensions of node features

(a) Random masking

(b) Hyperedge-aware masking

□ Self-Supervised Contrastive Hypergraph Learning

■ Contrastive loss

$$\mathcal{L}_{con} = \underbrace{-\log \text{sim}(\mathbf{Z}_{(1,V)}, \mathbf{Z}_{(2,V)})}_{\text{node-level contrast}} - \underbrace{\log \text{sim}(\mathbf{Z}_{(1,E)}, \mathbf{Z}_{(2,E)})}_{\text{group-level contrast}},$$

■ Unified loss of CASH

$$\mathcal{L} = \mathcal{L}_{pred} + \beta \mathcal{L}_{con}$$

Hyperparameter sensitivity

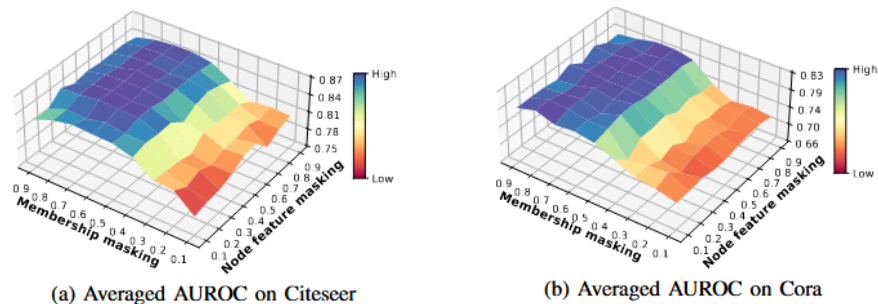

Control parameter β

Insensitive to its hyperparameter β

Augmentation parameter p_m, p_f

p_m is more important than p_f

Experiments

□ Efficiency

■ Scale up linearly

(a) Citeseer

(b) Cora

(c) DBLP-A

(d) DBLP

Conclusion

□ Real world (hyper)graphs are “sparse”

□ Graph Contrastive Learning

- Maximize the agreement between the two views

□ Challenges

- How to augment a hypergraph?
- What to contrast?

Conclusion

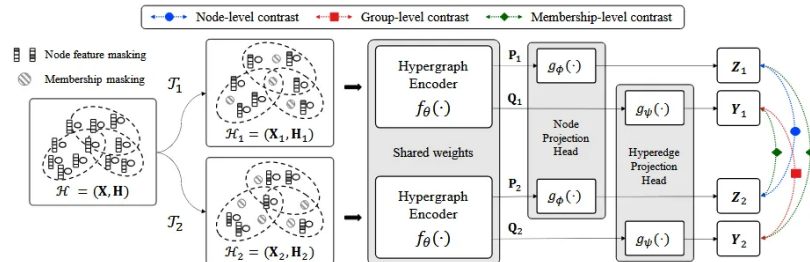

HyperGCL

- Augmentation of hypergraph can be learned during contrastive learning using variational hypergraph auto-encoder

TriCL

- Node + Group + Membership contrast

CASH

- Context-Aware Hyperedge Prediction
- Hyperedge-aware masking

Fig. 2. The overview of CASH: (1) Context-aware hyperedge prediction (upper) and (2) Self-supervised contrastive hypergraph learning (lower).
