

Temporal Hypergraph Learning

How can the model learn temporal and higher-order interactions?

SuYong Jeong
Machine Intelligence and Data Science Laboratory

Outline

- ☐ About Hypergraphs
- ☐ Temporal Hypergraphs
- ☐ CAT-WALKS
- ☐ FastHeP

Hypergraphs

- Natural representation of higher-order interactions
- More expressive than pairwise graphs
- Real-world applications: co-authorship, co-purchase networks, and MINDS chatroom

Co-authorship

Co-purchase of items

MINDS chatroom

Various Hypergraph Modeling Approaches

- Clique/star expansion
- Directed graph modeling with hyperedge weights and EDVW (Edge-dependent vertex weights)
- Direct modeling of hyperedges without decomposition

Clique/Star Expansion

Representative Directed graph (2020)

HyperSAGNN (2020)

Limitations of Hypergraphs – Dynamic Features

- ❑ Static hypergraph modeling capturing only the final state of hypergraphs
- ❑ Continuous network evolution over time
 - Failure to capture temporal evolutions in hypergraphs
 - Loss of temporal order among higher-order interactions

2025 Fall

2026 Spring (current)

???

Temporal Hypergraph Learning

- Temporal hypergraph, a sequence of hyperedges with timestamps
- Modeling time-dependent, higher-order interactions
- Predicting future higher-order interactions

Simple Static Hypergraph

Temporal Hypergraph

Upcoming Topics

- Two Models to represent complex higher-order relationships with temporal features
 - Considering both structural and temporal information
- CAAt-Walk: Causal anonymous set walks
 - A hyperedge-centric random walk on hypergraphs, SetWalk
 - Learning the underlying dynamic laws that govern the temporal and structural processes
- FastHeP: Fast and accurate approach for temporal hyperedge prediction
 - A hybrid message passing method
 - Strong expressiveness, high time & memory efficiency, and good scalability

CAt-Walk: Inductive Hypergraph Learning via Set Walks

Ali Behrouz, Farnoosh Hashemi, Sadaf Sadeghian, Margo Seltzer

University of British Columbia

NeurIPS '23

Existing Temporal Hypergraph Model - HIT

- Using **temporal random walk** to extract temporal motifs
- Prediction of underlying network laws via temporal structural information learning
- Applicable only to **triplets** $\{u, v, w\}$

Problems of Existing Model

- Hyperedges are sets of nodes, but random walks are represented as sequences of nodes
- Equivalence to random walks on a weighted clique expansion
- **Loss of the semantic meaning of hyperedges**

Methodology - Causal Anonymous Set Walks

- SetWalk -> a hyperedge-centric random walk on hypergraphs
- Learning temporal hypergraph motifs that reflect network dynamic laws

Network Dynamic Laws

Causality Extraction via Set Walks

- Sequence of hyperedges generated by random walks
 - Sw : $(e_1, t_{e_1}) \rightarrow (e_2, t_{e_2}) \rightarrow \dots \rightarrow (e_\ell, t_{e_\ell})$
- Biased random walk with temporal bias and structural bias
 - Transitions toward structurally and temporally similar hyperedges

$$\mathbb{P}[(e, t)|(e_p, t_p)] \propto \frac{\exp(\alpha(t - t_p))}{\sum_{(e', t') \in \mathcal{E}^{tp}(e_p)} \exp(\alpha(t' - t_p))} \times \frac{\exp(\varphi(e, e_p))}{\sum_{(e', t') \in \mathcal{E}^{tp}(e_p)} \exp(\varphi(e', e_p))}$$

Set-based Anonymization of Hyperedges (cont.)

□ Position-wise counting of node occurrences in SetWalks

■ $e_0 = \{u_1, \dots, u_k\}$, node $w = \bigcup_{i=1}^k \mathcal{S}(u_i)$

■ $\mathcal{R}(w, \mathcal{S}(w_0))[i] = |\{\text{Sw} | \text{Sw} \in \mathcal{S}(w_0), w \in \text{Sw}[i][0]\}| \quad \forall i \in \{1, 2, \dots, m\}.$

Candidate hyperedge: $e_0 = \{A, B\}$

Set walks of node A: $S(A) = \{\text{Sw}_1, \text{Sw}_2\}$

$\text{Sw}_1 : (\{A, C\}, 10) \rightarrow (\{A, C, D\}, 8) \rightarrow (\{C, D\}, 5)$

$\text{Sw}_2 : (\{A, B\}, 9) \rightarrow (\{B, C\}, 7) \rightarrow (\{B, D\}, 4)$

Set walks of node B: $S(B) = \{\text{Sw}_3, \text{Sw}_4\}$

$\text{Sw}_3 : (\{A, B\}, 11) \rightarrow (\{B, C\}, 8) \rightarrow (\{C, E\}, 6)$

$\text{Sw}_4 : (\{B, D\}, 10) \rightarrow (\{A, B, D\}, 7) \rightarrow (\{A, D\}, 3)$

All nodes appeared in Set Walks

$$\begin{matrix} \{A, B, C, D, E\} \rightarrow R(A, S(A)) = [2, 1, 0] & R(A, S(B)) = [1, 1, 1] \\ & R(E, S(A)) = [0, 0, 0] \quad \dots \quad R(E, S(B)) = [0, 0, 1] \end{matrix}$$

Node-dependent node identity

$$\text{ID}(w, e_0) = \{\mathcal{R}(w, \mathcal{S}(u_i))\}_{i=1}^k \rightarrow \begin{matrix} \text{Id}(A, e_0) = \{[2, 1, 0], [1, 1, 1]\} \\ \text{Id}(E, e_0) = \{\ddots, [0, 0, 1]\} \end{matrix}$$

Set-based Anonymization of Hyperedges

□ SetMixer

- Hyperedge anonymization using anonymized nodes
- **Permutation-invariant pooling strategy**
- Representation of hyperedges in SetWalks with respect to an anchor hyperedge

$$\text{Id}(e, e_0) = \Psi_1 \left(\left\{ \Psi_2 (\text{Id}(w_i, e_0)) \right\}_{i=1}^{k'} \right) \Psi(.) : \mathbb{R}^{d \times d_1} \rightarrow \mathbb{R}^{d_2}$$

Hyperedge Anonymization

$$\mathbf{H}_{\text{token}} = \mathbf{V} + \sigma \left(\text{Softmax} \left(\text{LayerNorm}(\mathbf{V})^T \right) \right)^T \Psi(S) = \text{MEAN} \left(\mathbf{H}_{\text{token}} + \sigma \left(\text{LayerNorm}(\mathbf{H}_{\text{token}}) \mathbf{W}_s^{(1)} \right) \mathbf{W}_s^{(2)} \right)$$

SetMixer

Details of SetMixer (cont.)

$$SW_1 : (\{A, C\}, 10) \rightarrow (\{A, C, D\}, 8) \rightarrow (\{C, D\}, 5)$$

$$Id(e, e_0) = \Psi_1 \left(\underbrace{\{\Psi_2 (Id(w_i, e_0))\}_{i=1}^{k'}}_{\text{red arrow}} \right) \quad \Psi(.) : \mathbb{R}^{d \times d_1} \rightarrow \mathbb{R}^{d_2}$$

$$Id(A, e_0) \quad \mathbf{H}_{\text{token}} = \mathbf{V} + \sigma \left(\text{Softmax} \left(\text{LayerNorm}(\mathbf{V})^T \right) \right)^T \quad \Psi(S) = \text{MEAN} \left(\mathbf{H}_{\text{token}} + \sigma \left(\text{LayerNorm}(\mathbf{H}_{\text{token}}) \mathbf{W}_s^{(1)} \right) \mathbf{W}_s^{(2)} \right)$$

$$= \{[2, 1, 0], [1, 1, 1]\}$$

$$R(A, S(A)) \quad R(A, S(B))$$

$$V_A = \begin{bmatrix} 2 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

Zero-padding

Details of SetMixer

$$SW_1 : (\{A, C\}, 10) \rightarrow (\{A, C, D\}, 8) \rightarrow (\{C, D\}, 5)$$

$$Id(e, e_0) = \Psi_1 \left(\{\Psi_2 (Id(w_i, e_0))\}_{i=1}^{k'} \right) \quad \Psi(.) : \mathbb{R}^{d \times d_1} \rightarrow \mathbb{R}^{d_2}$$

$$\mathbf{H}_{\text{token}} = \mathbf{V} + \sigma \left(\text{Softmax} \left(\text{LayerNorm}(\mathbf{V})^T \right) \right)^T \quad \Psi(S) = \text{MEAN} \left(\mathbf{H}_{\text{token}} + \sigma \left(\text{LayerNorm}(\mathbf{H}_{\text{token}}) \mathbf{W}_s^{(1)} \right) \mathbf{W}_s^{(2)} \right)$$

$$\mathcal{Z}_A$$

$$\Psi_2(\{[2, 1, 0], [1, 1, 1]\})$$

$$\mathcal{Z}_C$$

$$\Psi_2(\{[1, 2, 1], [0, 1, 1]\})$$

Zero-padding

SetWalk Encoding

□ Using RNN or Transformer in previous walk-based methods

- Computational cost
- Fail to capture long-term dependencies
- Causing over-squashing

□ A time encoding module

$$\mathbf{T}(t) = (\omega_l t + \mathbf{b}_l) \parallel \cos(t\omega_p)$$

□ A mixer module

- Summarizing temporal and structural information extracted by SetWalks

$$\text{ENC}(\text{Sw}) = \text{MEAN} \left(\mathbf{H}_{\text{token}} + \sigma \left(\text{LayerNorm}(\mathbf{H}_{\text{token}}) \mathbf{W}_{\text{channel}}^{(1)} \right) \mathbf{W}_{\text{channel}}^{(2)} \right),$$

$$\text{where } \mathbf{H}_{\text{token}} = \mathbf{E} + \mathbf{W}_{\text{token}}^{(2)} \sigma \left(\mathbf{W}_{\text{token}}^{(1)} \text{LayerNorm}(\mathbf{E}) \right). \quad \mathbf{E}_i = \text{Id}(e_i, e_0) \parallel \mathbf{T}(t_{e_i})$$

Experimental Setup

- ☐ Baselines
 - Deep hypergraph learning methods (HyperSAGCN, NHP, CHESHIRE)
 - CE methods (CE-CAW, CE-EvolveGCN, CE-GCN)
- ☐ Ten datasets
- ☐ Downstream tasks
 - Hyperedge prediction
 - Node classification
- ☐ Transductive and inductive settings

Hyperparameter Sensitivity

- Only a small number of sampled SetWalks are needed to achieve competitive performance
- Requirement for appropriate sampling time bias setting

Conclusion

Existing Models

- Higher-order interactions information loss due to clique expansion

CAt-Walk

- A hyperedge-centric random walk on hypergraphs, SetWalk
- A permutation invariant pooling strategy, SetMixer

Fast and Accurate Temporal Hypergraph Representation for Hyperedge Prediction

Yuanyuan Xu, Wenjie Zhang, Ying Zhang, Xiwei Xu, Xuemin Lin

¹University of New South Wales, ²Zhejiang Gongshang University, ³CSIRO Data61, ⁴Shanghai Jiao Tong University

KDD '25

Causal Anonymous Set Walks

- Extracting higher-order interactions with Set Walks, hyperedge-centric random walk
- SOTA temporal hypergraph approach

Computational Costs

□ High time cost for computation graph construction in set walks

- Per-neighbor hyperedge computation cost $\rightarrow O(|H_{\mathcal{E}}|K^L)$
- Per-node computation cost $\rightarrow O(|H_{\mathcal{E}}|^2 K^L)$
- Expensive storage costs $\rightarrow O(|V||\mathcal{E}|)$

□ Failing to process large temporal hypergraphs

Computation Graph Analysis

- CAT-Walk exhibits a high rate of redundant neighbors, up to 76%
- Redundant neighbors dominating the hyperedge representation
 - Despite the diversity of neighbors in the computation graph
- **Over-smoothing** problem and sub-optimal embedding quality

- Fast and accurate hypergraph representation approach for the temporal hyperedge prediction
 - $H_i \rightarrow \mathbf{h}_i(t_j) \in \mathbb{R}^d$
- An online hyperedge-centric neighbor store (HCNS)
 - No needs for an $O(|\mathcal{V}||\mathcal{E}|)$ incidence matrix
 - $O(|H_{\mathcal{E}}|K)$ -based local high-order structure capture
- Decoupling multi-hop hyperedge-centric message passing
 - Into hybrid node-wise and hyperedge-wise message passing

Hyperedge-Centric Neighbor Store, HCNS (cont.)

- $O(\overline{H_{\mathcal{E}}}|K)$ -based local high-order structure capture
 - No needs for an $O(|\mathcal{V}||\mathcal{E}|)$ incidence matrix
 - Storing a limited number of temporal neighbors for each node
 - $\mathcal{N}_v^K(t) : \{(v_i, t_j) \rightarrow s_{v,v_i}(t_j)\}, \exists \mathcal{V}_n, s.t., \{v, v_i\} \subseteq \mathcal{V}_n, n \leq |\mathcal{E}|, t_j \leq t.$
- Allocating a fixed-sized hash table
 - For each node v to store its K hyperedge-centric neighbors, $\mathcal{N}_v^K$
 - The hash function for the input (v_n, t_j) as $\text{hash}(v_n, t_j) = (\rho v_n) \bmod K$
 - A replacement rule based on θ , where $\theta \in [0.5, 1]$

Hyperedge-Centric Neighbor Store, HCNS

- $s_{v_i, v_n}(t)$ can store flexible values
 - Hyperedge features, node features, and time encoding features
 - Consuming at most $O(|\mathcal{V}|K(d_h + d_f + d_t))$ GPU memory
- $s_{v_i, v_n}(t) = \text{GRU}([s_{v_i, v_*}(t^-), \mathbf{e}(t), \phi(t - t^-), \mathbf{x}_{v_n}])$
 - Encoding the temporal dynamics of neighbors
- Similar to SetWalks in CAT-Walk

Temporal High-Order Structure Learning (cont.)

□ A novel hybrid message passing (blue box)

- Node-wise
- Hyperedge-wise message passing

□ Node-wise message passing (green box)

- $z_i(t) = \text{MLP}(z_i(t^-) \parallel \text{GAT}(q(t), \kappa(t), \nu(t)))$,
- $q(t) = z_i(t^-), \kappa(t) = \nu(t) = \{s_{v_i, v_n}(t_j) \mid \forall (v_n, t_j) \in \mathcal{N}_{v_i}^K(t)\}$
- Local high-order structure information and temporal dynamics

Temporal High-Order Structure Learning

□ Hyperedge-wise message passing (green box)

$$\blacksquare \hat{h}_j(t) = \frac{1}{|H_j|} \sum_{i=1}^{|H_j|} \text{MLP}(z_i(t)), \forall j \in \{1, \dots, |B|\}, \quad (6)$$

- $\hat{h}_j(t)$ in Eq. (6) is the j -th hyperedge features of $\hat{H}(t)$
- Permutation invariant with mean-pooling
- Local higher-order structure

$$\blacksquare H(t) = \hat{H}(t) + \text{ATT}(\mathbf{q}_h(t), \boldsymbol{\kappa}_h(t), \mathbf{v}_h(t)), \quad (7)$$

$$\mathbf{q}_h(t) = \boldsymbol{\kappa}_h(t) = \mathbf{v}_h(t) = \hat{H}(t). \quad (8)$$

- Global correlation learning among hyperedges using $\text{ATT}(\cdot)$
- Using both local and global high-order structures

Comparison FastHeP with CAT-Walk

Computation graph complexity

- Hybrid structure learning
- $O(|H_{\mathcal{E}}|K)$ vs. $O(|H_{\mathcal{E}}|^2 K^L)$

Memory cost

- Hyperedge-centric neighbor store
- $O(|\mathcal{V}|)$ vs. $O(|\mathcal{V}||\mathcal{E}|)$

Experimental Setup

- ☐ Baselines
 - Temporal hypergraph approach (CAT-Walk)
 - Static hypergraph approach (NHP, HyperSAGCN, CHESHIRE)
 - CE methods (CE-CAW, CE-Zebra, and CE-Orca)
- ☐ Eight datasets
- ☐ Downstream tasks
 - Hyperedge prediction
- ☐ Transductive and inductive settings

Overall Efficiency Evaluation

- More efficient than CAT-Walk
- Scalability over large temporal hypergraphs

(a) Training GPU memory cost

(b) Per-epoch training time

(c) Inference time

☐ Existing Models, CAT-Walk

- A hyperedge-centric random walk on hypergraphs, Set Walk
- Causing sub-optimal embedding quality
- Incurring prohibitive computational complexity

☐ FastHeP

- Online hyperedge-centric neighbor store
- A hybrid message passing
- Learning local high-order structures, fusing them to model global high-order correlations

Thank you
